

Heart disease is more than blocked arteries

Over 2 million Americans have faulty heart rhythms.

Your symptoms might be barely noticeable, but an abnormal heart rhythm (arrhythmia) may significantly increase your risk of stroke, heart attack and cardiac arrest.

Until now, most Seacoast patients with abnormal heart rhythms were referred to Boston-area electrophysiology labs. We welcome our team of Board Certified electrophysiologists, cardiologists with advanced training and experience in the diagnosis and treatment of problems in the heart's electrical system.

Thanks to the addition of Dr. Bruce Hook and Dr. David Martin to Atlantic Cardiology Associates and the Heart & Lung Center medical staff, comprehensive electrophysiology services are now available in Portsmouth. Along with Dr. David Cunningham of Seacoast Cardiology Associates, they employ a variety of treatment approaches to enhance heart health, including medication, cardioversion, internal defibrillator and pacemaker implantation.

Symptoms of Cardiac Arrhythmia May Include:

- Palpitations
- Lack of energy
- Dizziness
- Chest discomfort
- Shortness of breath

Treatment focuses on restoring and maintaining a normal heart rhythm and heart rate.
